Flagship Initiative

Launch of the joint Innosuisse-armasuisse call 2026

Guide for applicants

This document outlines the details of the application process for the call 2026 for proposals within the framework of Innosuisse's funding instrument "Flagship Initiative".

The call for pre-proposals will close on Tuesday, 27 October 2026 (12 o'clock / noon CET)

Please note that the legal basis of the Flagship Initiative will be revised in some points and is expected to enter into force on 1 January 2027. Innosuisse will publish an updated version of the Guide for applicants after the pre-proposal phase and applicants will have to take into account the new applicable legal basis when preparing and submitting their proposals.

Glossary and acronyms

Abbreviation	Meaning
Flagship	A flagship consists of closely linked and interdependent subprojects conducted by a consortium, which includes multiple research and implementation partners from different disciplines.
Flagship initiative	Under the Flagship Initiative, Innosuisse defines flagship topics. Consortia within these topics can submit proposals to implement a flagship.
Flagship representative	The flagship representative serves as the main contact person for Innosuisse and is affiliated with the host institution.
Flagship topics	These are specific themes defined by Innosuisse within the Flagship Initiative framework.
Funding Ordinance	The Ordinance of the Innosuisse Board of Directors on its support measures of 4 July 2022 (CC 420.231).
HEI	Higher Education Institution, including ETH/EPF, cantonal universities, and universities of applied sciences.
Host institution	The host institution is a higher education institution (HEI) or a non-commercial research institution outside the university sector that acts as the funding management body on behalf of the consortium. It assumes overall responsibility towards Innosuisse for the management and coordination of the flagship.
Implementing Provisions	The Swiss Innovation Agency's implementing provisions for funding innovation projects of 2 September 2022.
MTR	Midterm Review
p-pr	Pre-proposal
pr	Proposal
RIPA	The Federal Act on the Promotion of Research and Innovation of 14 December 2012 (CC 420.1).
UAS	University of Applied Sciences

1 The funding instrument “Flagship Initiative”

The purpose of the flagship initiative is to stimulate innovation in areas relevant to a large part of the economy or society and to promote transdisciplinary project collaboration. The Initiative strives for solutions to current or future challenges, which concern several actors and/or can only be solved through collaborative work. Innosuisse is therefore defining specific but broad flagship topics in order to encourage applicants to address issues that are of particular interest for the future well-being of the country, and where new solutions and business models are required. This new funding instrument is complementary to the purely bottom-up oriented and well-established regular innovation projects.

Systemic innovation, where value can only be derived if it is synergistically integrated with other complementary innovations, and transdisciplinarity, where actors from different disciplines collaborate, are key components of this new funding instrument.

The overall objective is to strengthen the competitiveness of the Swiss economy and/or contribute to the well-being of society by creating new value along the value chain by increasing efficiencies, reducing costs or re-solving social relevant challenges in the public interest.

Under the Flagship Initiative, Innosuisse invites consortia to submit proposals for implementing flagship (Figure 1). Each flagship proposal consists of closely connected and interdependent subprojects (Figure 2). As a rule of thumb, a flagship should consist of three to eight sub-projects. Flagship proposals must be submitted by a consortium comprising multiple research and implementation partners from diverse disciplines (Figure 3).

Figure 1: Flagship Initiative Structure

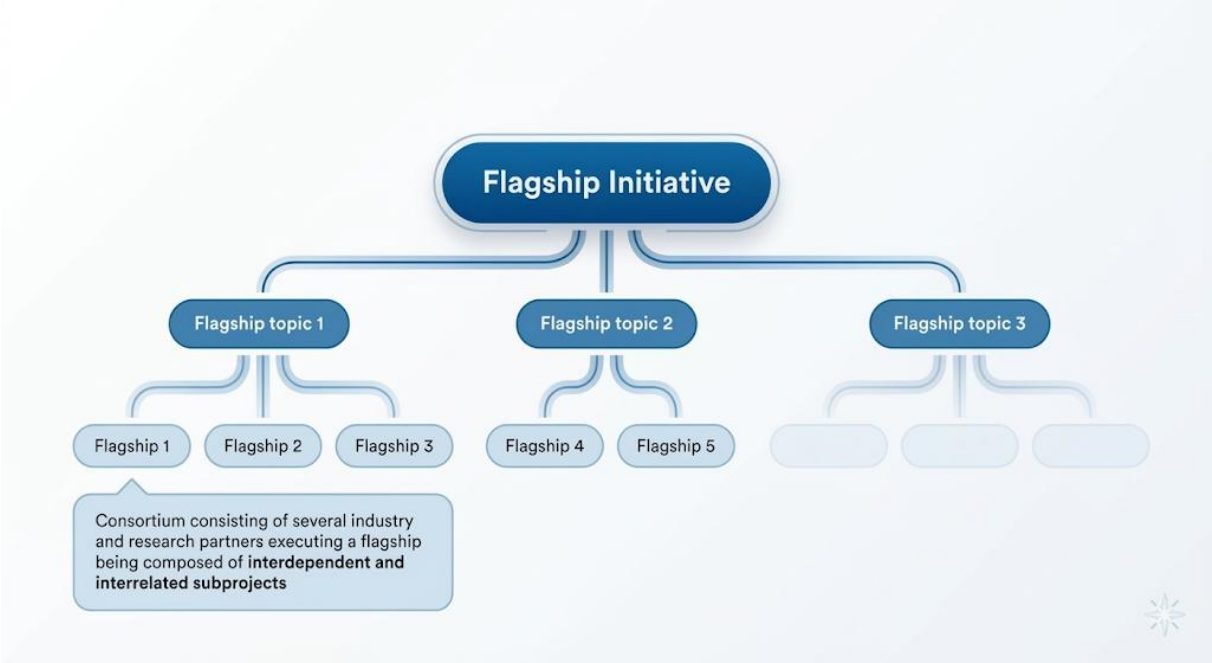

Figure 2: Example of a schematic representation showcasing the interrelation and interdependence of subprojects that collectively form a flagship.

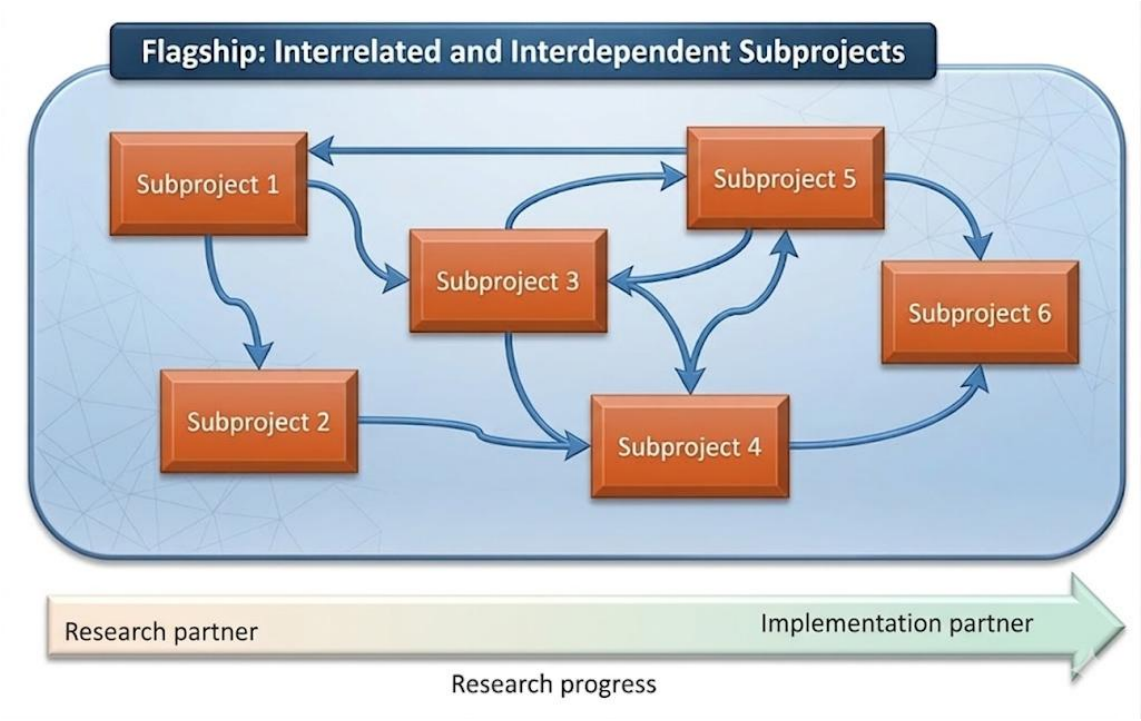

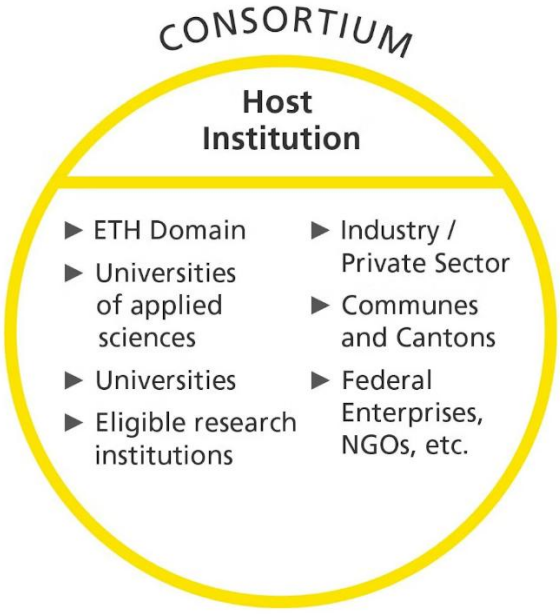

Figure 3: Structure of a consortium executing a flagship (example).

Flagships are characterized by a systemic, transdisciplinary perspective and a focus on practical solutions. Priority is given to **systemic innovation** rather than the incremental improvement of existing systems (e.g., merely increasing efficiency or material properties). Instead, Flagships aim for long-term transformation, such as integrated mobility management or the circular economy.

Crucially, it is not the result of a single subproject that drives change, but the synergy of interdependent subprojects working together. Therefore, strong **transdisciplinary collaboration** between academia and industry is essential. A proposed Flagship will only be considered if it demonstrates that the **overall systemic result is greater than the sum of its individual parts**.

Definition of systemic innovation

Systemic innovation is a type of innovation where value can only be derived if it is synergistically integrated with other complementary innovations, going beyond the boundaries of a single organization. Systemic innovation requires multiple innovations to be coordinated. Consequently, the different contributory innovations and organizations are organized together into a whole system, where the overall success of the emergent innovation cannot be attributed to just one sub-innovation or participating organization.[1]

Definition of transdisciplinarity

Transdisciplinary is a way of thinking that rises above and beyond the methods of individual disciplines, seeing multiple levels of meaning rather than simple dichotomies. Transdisciplinarity recognizes the existence of a complex and dynamic reality that transcends the boundaries of disciplines and requires a holistic and integrative approach.[2]

2 Call Announcement

2.1 Flagship topic of the call 2026

In an increasingly volatile security and geopolitical environment, physical and digital infrastructures, mobility systems and security-relevant applications are exposed to ever more complex threats. Technological dependencies on vulnerable or externally controlled systems can significantly restrict the ability of government, the economy and society to act. Resilient and secure key technologies that operate reliably under disrupted or hostile conditions are therefore essential to safeguard the long-term functioning of Swiss critical infrastructures and national security.

The 2026 Flagship call is established as a joint and co-funded initiative between Innosuisse and armasuisse to address these challenges through the development of dual-use technologies. This partnership aligns the strategic mandates of both organisations to strengthen Switzerland's resilience and technological sovereignty. Simultaneously, the call is aligned with the 2025 armaments policy strategy of the Federal Council.

The Flagship topic of the 2026 call is therefore:

Resilient and Secure Technologies for Defence and Mobility

To address this overarching objective effectively, the 2026 call concentrates on three complementary focus areas. They cover key technological enablers that are of strategic importance both for defence capabilities and for secure, highly available mobility. The Flagships are expected to develop systemic solutions that integrate one or several of these areas and thus make a measurable contribution to Switzerland's technological sovereignty and resilience.

The three focus areas of the call are:

1. **Resilient positioning, navigation and timing (PNT)**
2. **Photonics for communication and sensor applications**
3. **Innovative technologies to counteract drones (C-UAV)**

The following sections describe these focus areas in more detail.

2.1.1 Resilient positioning, navigation and timing (PNT)

Precise and reliable positioning, navigation and timing (PNT) systems already form the backbone of modern society, the economy, national security and defence. Global navigation satellite systems (GNSS) such as GPS and Galileo are essential for numerous critical infrastructures. They not only determine precise location and movement for applications such as aviation and vehicle tracking but also provide highly accurate timing signals that synchronize critical infrastructures, including telecommunications networks, power grids, and financial transaction systems. However, GNSS signals are extremely weak and therefore particularly susceptible to radio frequency interference (jamming) and signal manipulation (spoofing). In recent years, the frequency of such interference, especially spoofing attacks, has increased dramatically. It is estimated that over one thousand flights are unintentionally affected by GNSS-spoofing every day. These disruptions are primarily caused by military electronic warfare systems operated by state actors in conflict zones, used, for example, to defend against drones or to influence GPS-guided munitions.

A GNSS failure is expected to have far-reaching and cascading consequences that go far beyond security-critical systems. Given the current vulnerability of GNSS-based PNT solutions, the use of multiple independent, complementary technologies to create a resilient overall system is becoming increasingly important. Ensuring future-proof PNT capabilities requires both efforts to enhance the resilience and robustness of existing systems, and the development of alternative GNSS-independent technologies that do not rely on exposed infrastructures. Such technologies offer significant potential in both civil domains, such as aviation, critical infrastructure, autonomous systems and emergency response, and in the field of defence, underlining their dual-use character and their overall economic and societal importance.

Strengthening national PNT resilience across critical civil and security-related applications requires a trans- and interdisciplinary approach. The aim of this focus area is to foster systemic innovation that develops and demonstrates sovereign, complementary PNT solutions capable of improving GNSS resilience or operating independently of GNSS. This includes exploring and integrating a broad range of technologies, such as inertial sensors, quantum-based timing and navigation methods, precision clocks, innovative antennas, new anti-jamming algorithms and software-based solutions, while remaining open to additional technologies and novel approaches. Also the integration of cyber resilience and anomaly detection is within scope to enhance the robustness and trustworthiness of PNT solutions.

2.1.2 Photonics for communication and sensor applications

Photonics, the science of manipulating light, is becoming essential for modern defence technologies. With evolving security threats, defence systems require advanced capabilities for rapid threat detection, secure communication, and reliable operation in complex environments. Switzerland's strong photonics research and innovative industry make it well-positioned to develop cutting-edge photonics solutions that will strengthen national defence and technological sovereignty.

The aim of the focus area is to develop next-generation photonic components and integrated systems specifically tailored for defence applications, while also enabling dual-use innovations with broad industrial impact. In scope are photonics technologies for **sensor and communication applications (not limited to the examples below)** such as:

- **Secure high-bandwidth optical communication technologies**, incorporating quantum-safe encryption and anti-jamming features to protect sensitive defence information.
- **Quantum key distribution technologies and Quantum photonics techniques**, to future-proof defence communication systems against emerging security threats. Enabling ultra-secure communication by using quantum mechanics principles to distribute encryption keys in a way that any interception attempt can be detected, making them highly relevant for protecting sensitive data.
- **Low probability of intercept optical communication channels** to minimize detectability and resist electronic warfare and cyber-attacks.
- **High-power, tunable laser sources optimised for LIDAR applications**, providing precise 3D mapping and target detection even in adverse weather or battlefield conditions.
- **Hyperspectral and thermal imaging sensors** to enable detection of concealed threats through advanced spectral analysis and to enhance night vision capabilities.
- **Active imaging** to image through camouflage, vegetation, smoke and fog.
- **Low-photon techniques and detection of optics** for the affordable adoption of high-performance photon counting technologies in active and passive imaging including advanced SPAD (Single-Photon Avalanche Diode) technologies. Retroreflection detection is a powerful means of locating adversary sighting systems. Low-photon techniques reduce the probability that retroreflection systems themselves are detected.
- **Low-power neuromorphic imaging and computing optimized for military applications**, where digital readout technology of neuromorphic sensors promises to reduce electrooptical/infrared (EO/IR) system costs and power consumption while delivering greater performance compared to conventional sensor designs. Neuromorphic inspired pre-processing framework combining optical-domain and electronic computing to accelerate onboard image processing.

The call encourages interdisciplinary approaches that leverage Switzerland's strengths in photonics, quantum technologies, space technologies, artificial intelligence, and systems integration to deliver innovative photonics solutions with relevance for both defence and civilian applications.

2.1.3 Innovative technologies to counteract drones (C-UAV)

Unmanned aerial vehicles (UAVs) pose a major challenge to the security of society, the economy and critical infrastructure. The rapidly increasing availability and advancing technology of drones are creating new opportunities for both civilian and government actors, but at the same time they pose substantial risks through hostile use. Counter-UAV (C-UAV) systems are therefore crucial to effectively mitigate threats related to hybrid conflicts and warfare, including espionage, sabotage, and attacks on critical infrastructure. The strategic importance of C-UAV technologies will continue to grow in the coming years and is vital not only on the battlefield but also for protecting airports, urban areas and other critical infrastructures.

Current C-UAV systems face various challenges. Limited detection accuracy for discriminating drones from other flying objects such as birds and the limited detection range make it difficult to identify drones. Additionally, the speed and manoeuvrability of drones make it difficult to detect drones quickly and the limited response time makes it even more challenging to take effective countermeasures in time. The ongoing improvements in drone technology are resulting in an evolving threat landscape. Some drones contain signature-reducing technologies or are equipped with jamming/spoofing protection technologies, making current mitigation strategies less effective. Furthermore, fibre-optic cable drones, capable of operating over distances up to 50 km, have been used in Ukraine, and coordinated drone swarms are expected to be the next major threat. In addition to the technical and tactical challenges, there is also the challenge posed by the asymmetry of costs, which currently favours the attackers. The measures required to defend against attacks can far exceed the cost of the attacking drone itself. This leads to the consumption of expensive ammunition that is actually designed for combating high-value assets. In addition, collateral damage risks arising from the countermeasures must be reduced.

C-UAV systems consist of three key elements:

- **Detection, identification and tracking,** through technologies such as advanced sensor and radar technologies, radio frequency spectrum monitoring, electro-optical and infrared imaging and acoustic detection arrays.
- **Resilient command & control architecture,** including multi-modal sensor fusion and integration platforms and software-based solutions.
- **Active counter-drone measures,** such as directed energy weapons, electronic warfare systems, kinetic interceptor systems and drone interceptors.

The development of effective and deployable C-UAV systems requires a transdisciplinary approach. Only by doing so can solutions be created that meet the high requirements for safety and efficiency and consider the legal and ethical challenges. The Flagship Initiative aims to promote systemic innovation that contributes significantly to strengthening national resilience and protection of the population and infrastructure from hostile drone threats.

2.2 Eligible structure and call specifications

Partners

The invitation to tender is addressed to consortia comprising both research[3] and implementation[4] partners. The consortium consists of at least three research partners, of which at least one is a university of applied sciences, and at least two implementation partners.

Only research institutions that are recognised as eligible research partners by Innosuisse may participate as research partners in a Flagship.

In order to be eligible as a non-commercial research centre outside of the higher education sector and to submit an application for contributions to innovation projects, the research centre must meet the requirements of Article 5 RIPA and Article 10 of the Innosuisse's implementing provisions for innovation projects. These requirements are outlined in the following information sheet: Information on the requirements and criteria for non-commercial research centres outside the higher education sector

Important: All documents required for non-commercial research centres outside the higher education sector must already be submitted at the pre-proposal stage. The final eligibility decision for the same organisation is taken during the proposal phase. If the result of the eligibility review is negative, the funding application for a project is not materially assessed and a non-consideration decision is taken.

The Flagship should only include implementation partners who make a substantial contribution to the project's execution and implementation. In addition, for the purposes of this call, the Federal Office for Defence Procurement (armasuisse) will not be available as an implementation partner.

While Innosuisse does not prescribe the internal organization of the consortium, a Higher Education Institution (HEI) or a non-commercial research institution outside the university sector[5] must act as the Host Institution taking over the role of the funding management body[6]. The Host Institution represents the project partners vis-à-vis Innosuisse during the application process and throughout the Flagship's duration. Furthermore, it must appoint a representative to serve as the primary point of contact for Innosuisse.

During the implementation phase, the consortium composition may change (new partners joining or existing ones withdrawing), provided that the original objectives remain unaffected and contractual conditions are upheld. Any such changes require prior written approval from Innosuisse and, where necessary, a corresponding contract amendment.

[3] Definition of research partner according to Art. 7 Innosuisse funding ordinance (as of 1.1.2023)
[4] Implementation partners are private or public institutions or companies that ensure implementation, Art. 19 para. 1 RIPA (as of 1.1.2023)
[5] Art. 5 RIPA
[6] Art. 13 Innosuisse Funding Ordinance as well as Art. 13 of the Implementing Provisions for Innovation Projects.

Dual-Use requirement

Flagship proposals submitted in the framework of the Call 2026 and their targeted innovations must be designed to provide a clear dual-use perspective, i.e. they must be relevant for both civil and defence-related applications. Projects that pursue a purely defence or a purely civil single-use objective are not eligible for funding under this call. This dual-use character will be explicitly queried in the application forms and must be substantiated by the consortium in the (pre-)proposal.

Ethics and research security

Ethics and knowledge-/research security play an important role in this call.

Innosuisse promotes innovations that meet ethical standards, which translates in behaviour and intentions not harming the dignity of humans and animals, life, health, freedom, property, the environment, or peaceful coexistence.

Knowledge & research security refers to the prevention of the unwanted transfer of sensitive information, know-how, and technology, the mitigation of foreign interference in higher education and research, and the reduction of dependencies that could endanger national security and competitiveness. The aim of knowledge & research security is to protect core scientific values, innovative ideas, ensure that international cooperation remains ethical and safe, and safeguard national interests and values.

Project partners must duly consider these aspects in the design and conduct of their project as well as in their risk analysis (ethics and knowledge & research security by design). Specific questions on ethics and research security will be integrated into the application forms and the evaluation process. Innosuisse may carry out background checks if needed.

Duration

There are no strict conditions regarding the duration of a Flagship. However, it is anticipated that a Flagship will exceed the duration of a standard Innosuisse innovation project due to its systemic approach and transdisciplinary nature.

Budget

The regulations governing Innosuisse innovation projects apply (see Chapter 3).

2.3 Dates and deadlines in 2026 and 2027

Date	What	Who
1 July 2026	Launch of the call 2026	Innosuisse
13 August 2026	Webinar	Innosuisse
20 August 2026	Deadline for written questions	Applicants
1 September 2026	Publication of Q&A (FAQ) on Innosuisse website	Innosuisse
27 October 2026 (12 o'clock / noon)	**Submission deadline: Pre-proposal**	**Applicants**
February 2027	Dispatch of recommendation letters	Innosuisse
4 May 2027 (12 o'clock / noon)	**Submission deadline: Proposal**	**Applicants**
July 2027	Notification of decision	Innosuisse
August 2027	Provision of Funding Agreements	Innosuisse
Q4 2027 / Q1 2028	Start of funded flagships	Applicants

3 Finances

3.1 General principles

Innosuisse funding covers the personnel costs of research partners, including overhead and employer contributions, as well as material costs. Additionally, a dedicated portion of the budget may be allocated to management and coordination of the overall flagship initiative.

3.2 Eligible costs

Personnel costs

Personnel costs are eligible according to the Innosuisse funding ordinance (Art. 9, 10 and 12) and the implementing provisions for innovation projects (Art. 15 to 17). Innosuisse funding covers the effective wage costs of the research partner incl. overhead and employer contribution.

The personnel costs are calculated either using evidence of the gross salaries paid or the applicable notional hourly rates according to article 16 and 17 of the implementing provisions for innovation projects.

Material costs

Material costs are eligible according to the Innosuisse funding ordinance (Art. 9) and the implementing provisions for funding innovation projects (Art. 18). Only costs that are actually incurred and are absolutely necessary for the proper execution of the flagship are taken into account. All the planned material costs need to be included in the proposal.

Coordination costs

Certain coordination costs can be covered within this category which necessarily arise due to a coordination effort between the project partners, which is particularly high compared to ordinary national innovation projects, and which are not covered by personnel or material costs according to the implementing provisions for funding innovation projects (Art. 19).

3.3 Financing conditions

Innosuisse covers a certain amount of the direct costs of a flagship. The funds provided by Innosuisse flow exclusively and directly to the research partners and never to the implementation partners. The legal basis allows an Innosuisse contribution of 40 to 60%. The implementation partners contribute to the total costs of the flagship to the extent of 40 to 60% of the eligible direct overall project costs. This contribution comprises own work and services as well as a financial contribution to the research partners. The financial contribution amount to at least 5% of the overall project costs according to the Innosuisse funding ordinance (Art. 11).

4 Submission and Evaluation of an application

The application process is competitive and will be a 2-step procedure (Figure 4 and 5): pre-proposal and proposal. Submission of a pre-proposal is a mandatory prerequisite for submitting a full proposal.

The proposal must be submitted in English, German, French or Italian.

Applications must be submitted via Innolink, in accordance with the information on the Innosuisse homepage.

Important information on roles and responsibilities of Innosuisse and armasuisse:

In the context of this joint call, armasuisse has contributed to the definition of the topics and co-finances the call. The entire call, submission and evaluation process, however, is carried out according to the established procedures of Innosuisse. All evaluation steps are conducted under the responsibility of Innosuisse, and the funding decisions are taken exclusively by Innosuisse. armasuisse is not involved in the evaluation of applications or in the funding decisions and, for the purposes of this call, will not be available as an implementation partner.

4.1 Formal conditions of the application

Innosuisse will conduct a formal check of all pre-proposals and proposals. The following formal criteria need to be fulfilled. Pre-proposals and proposals that do not meet all formal criteria will be returned for revision or will result in non-consideration.

Important formal conditions (non-exhaustive list)	Will be checked at p-pr / pr-stage*
Has the application been received before the deadline set in the call?	p-pr and pr
Is the application an obviously insufficient application?	p-pr and pr
Does the consortium consist of at least three research partners?	p-pr and pr
Has the consortium chosen a topic?	p-pr and pr
Is at least one of the research partners a university of applied sciences?	p-pr and pr
Does the consortium consist of at least two implementation partners?	p-pr and pr
Are the research partners eligible for funding?	p-pr and pr
Does a HEI or a non-commercial research institution outside the university sector act as the host institution?	p-pr and pr
Has the application been submitted in English, German, French or Italian?	p-pr and pr
Have all questions of the forms been answered?	p-pr and pr
Have the financial conditions been met?	p-pr and pr
Was a pre-proposal submitted prior to the submission of the proposal?	pr

*p-pr = pre-proposal; pr = proposal

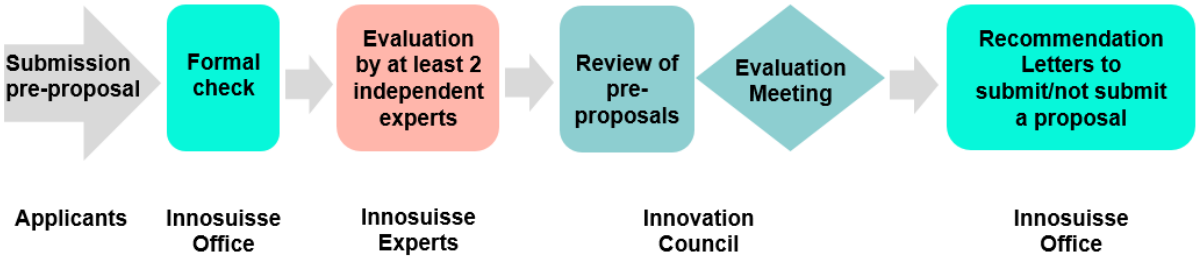

4.2 Pre-proposal

The submission of a pre-proposal is a mandatory prerequisite for eligibility to submit a full proposal. The pre-proposal must particularly include the following key information:

- **General Information & Abstract**: A concise overview of the project.
- **Flagship Partnership Details**: Information regarding the research and implementation partners.
- **Organizational Structure**: A visual chart illustrating the flagship's hierarchy and sub-projects.
- **Project Description**: A comprehensive outline of objectives, a preliminary project plan with milestones and deliverables, and a definition of the systemic innovation.
- **Consortium Composition**: Evidence of transdisciplinarity and collaboration across multiple stakeholder groups.
- **Financial Overview**: The intended budget request (a detailed financial plan is not required at this stage).

Following the evaluation, Innosuisse will issue a formal recommendation to the applicant regarding whether or not to proceed with the submission of a proposal.

Figure 4: Evaluation process pre-proposal

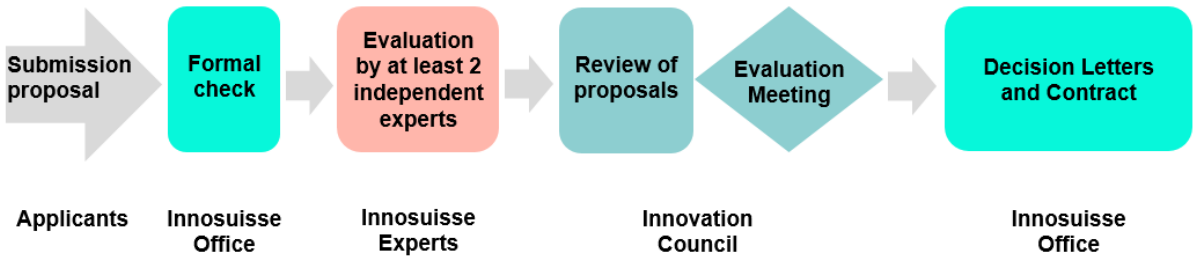

4.3 Proposal

The proposal must contain all information necessary for a comprehensive assessment against the applicable funding requirements and evaluation criteria and must follow the instructions provided in the official application form. It must provide a comprehensive and detailed account of the following aspects in particular:

- **Executive Summary & General Information**: A high-level overview of the project scope.
- **Consortium & Partnership Details**: Information on all research and implementation partners, specifically highlighting transdisciplinary collaboration and stakeholder integration.
- **Detailed description of the flagship** such as
    - **Value Creation**: Analysis of the business model, competitive landscape, Unique Selling Proposition (USP), market potential, as well as expected sustainability impacts (e.g. environmental, economic, and/or societal).
    - **Systemic Innovation & Novelty**: Assessment of the state of the art, innovative depth, systemic perspective, and the broader applicability of research results, including risk assessment and ambition (e.g., Technology Readiness Level).
    - **Implementation & Feasibility:** A concrete plan for the practical application and implementation of research results.
    - **Project Management & Schedule**: A detailed work plan comprising sub-projects, work packages, milestones, deliverables, and a risk analysis.
    - **Risk Management:** Detailed risk analysis and management (including Ethics and Research Security
    - **Financial Planning**: A detailed budget request including salary and material costs, as well as the financial and in-kind contributions from implementation partners.

IMPORTANT: The proposal must remain consistent with the pre-proposal. If the central objectives or research questions deviate significantly from the pre-proposal, the application will be rejected on formal grounds.

Figure 5: Evaluation process proposal

4.4 Evaluation criteria[7]

- **Innovation degree**: the innovative content of the project, measured against the current state of the science and the available solutions for the needs being addressed
  Is the scientific and economic/societal approach new? Is it not only «incremental» but also «systemic» innovation, which means, does the scientific and economic/societal approach contribute to change a system in the long term?
- **Value creation and sustainability in Switzerland:** the potential for effective implementation of the project results and the anticipated value creation for the Swiss economy or society; the contribution to the sustainable development of society, the economy and the environment; strengthening security and defence through resilient, trustworthy and future-oriented solutions.
  Does the implementation of the research results on the market have a positive influence on the competitive situation of the implementation partner(s)?
  Does successful implementation demonstrably reduce (social) costs and/or create economic benefit (e.g. increasing security, increasing the quality of life, reducing injustice, increasing biodiversity), which leads to a positive impact on the future well-being of the country?
- **Flagship set-up**
  - the quality of the project planning, qualitative and quantitative goals and implementation plans for generating the intended economic or social benefit
  - the abilities of the personnel; Do the project partners have the necessary competences for the execution and the intended implementation on the market? Is the consortium well positioned across disciplines (transdisciplinarity)?
  - the cost-benefit ratio.

4.5 Communication to applicants

The recommendations (pre-proposal) and decisions (proposal) of Innosuisse will be communicated to the consortium in writing.

Outcome Pre-proposal	
Recommendation	Innosuisse recommends, based on the evaluation of the pre-proposal, a submission of the proposal.
No recommendation	Innosuisse does not recommend, based on the evaluation of the pre-proposal, a submission of the proposal.

Outcome Proposal	
Non-consideration	The formal criteria (see also chapter 4.1) have not been fulfilled.
Rejection	The application has been assessed as less suitable, with regards to the evaluation criteria (see also chapter 4.4), for a flagship compared to the other applications.
Approval	The application for a flagship will be promoted and the funding agreement will be sent to the applicants.

[7] Art. 8 Innosuisse Funding Ordinance

5 Support

To ensure equal access to information for all applicants, please submit any questions regarding the call for proposals, the funding instrument, or other related topics to Innosuisse **by 20 August 2026** via email (programme@innosuisse.ch). Responses to all inquiries will be published collectively in the FAQ section on the webpage of Innosuisse to provide transparency to all potential participants.
