

→ **NATIONAL PRICE AND  
SALARY STATISTICS  
EXPRESSED IN EURO**

Specially produced by Sogeti for ESA, European Space Agency

## **Notice**

Since 1996, this Bulletin has been published by EUROSTAT under contract from ESA.

In November 2003, EUROSTAT notified ESA that the European Commission had decided to reorganise EUROSTAT and to re-focus its activities onto its core business, which is the production of Community Statistics within the framework of the European Statistical system. Furthermore, EUROSTAT stated that it would not be able to continue to produce this customised bulletin of price and salary data for ESA beyond the December 2003 issue.

The calculations and publication of the document have been contracted out by EUROSTAT and the Contractor since February 2003 has been the company SOGETI Luxembourg.

ESA has concluded a contract directly with SOGETI Luxembourg, to ensure the continuation of the publication of this Bulletin using the same methodology and sources of data as previously, including data provided by EUROSTAT.

Bulgaria, Croatia, Cyprus, Latvia, Lithuania, Malta and Slovakia are included under point 3 (Exchange rates) and point 5 (Consumer price indices).

## 1. Introduction

This issue contains all data retrieved and received by the 6th of August 2026, shown both as the original series and converted into EURO. This issue shows data for the years 2025 and 2026. Data back to 1995 remain in the source database and can be consulted upon request.

The table of exchange rates gives the value of 1 EURO in national currency for a range of countries, on a monthly, quarterly and annual basis. Countries which form the "Euro area" are indicated with 'Euro area' on the top of the tables (11 countries in 1999 –the euro being "book" money until 1 January 2001–, Greece in 2001, Slovenia in 2007, Cyprus and Malta in 2008, Slovakia in 2009, Estonia in 2011, Latvia in 2014 and Lithuania in 2015 and Croatia in 2023). The Official Journal of the European Communities, L 359, of 31 December 1998, includes the publication of Council Regulation 2866/98 adopting the fixed conversion rates for the first 11 Member States participating in the single European currency. This Council Regulation marked the beginning of the third and final phase of economic and monetary union. This Council Regulation has been amended several times to provide for the conversion rates for the new euro area countries.

The table of consumer price indices gives both national currency and EURO based series. There are in addition series on the purchasing power of the ECU/EURO (more details in the notes for section 4).

The names of the series are included in the original language and in English.

Data marked "p" is provisional and likely to be updated. Data in bold has been revised.

It is well possible that in the course of the year certain data series are discontinued or replaced. Explanations are given in the section under the relevant tables. Section 6 and Section 7 at the end of the publication summarise the information, separately by country.

Any questions concerning the distribution / dissemination of the bulletin can be addressed to:

## 2. Data by Country

On 1 January 1999, the EURO became the official currency of 11 EU Member States, with a fixed conversion rate against their national currencies. Since 1 January 1999, the fixed exchange rates are applied. Greece joined in 2001, Slovenia in 2007, Cyprus and Malta in 2008, Slovakia in 2009, Estonia in 2011, Latvia in 2014, Lithuania in 2015 and Croatia in 2023. The value of the EURO against all other currencies, including those of the Member States staying out of the Euro area will fluctuate according to market conditions.

All non-EURO series have been converted on a like for like basis - that means that index series on a national currency basis are converted to index series on a EURO basis, and series in national currency are converted to series in EURO. All converted series retain the same periodicity - quarterly, monthly - as the original series, and annual averages are only included where they exist in the original series. Index series in EURO are shown with the same number of decimal places as the original series, but currency series in EURO have the number of decimal places adjusted to retain the same number of significant figures as the original series.

Money series are converted by dividing the values in national currency by the exchange rate for the period in question as given in the table in Part 3. Index series are converted by adjusting the index value by the change in the EURO exchange rate index for that currency between the base period of the particular index and the period in question. The value of the EURO index will remain 100 in the base period.

Please note: When index series for Euro area Member States have been re-based by the national institutions to 1999 or later, they are only published as EURO series (without any conversion). The same is true for money series that are expressed solely in EURO by the national institutions.

The type of series is indicated after its title - I for Index or M for Money - together with the base period (the month, quarter or year for which the value of the index = 100) for index series.

All data in this bulletin are presented as they appear in the various sources. Hence, differences in the number of decimals within the same table can occur.

A few conventions should be noted. A fixed space is used to separate the thousands and the “.” to indicate decimals.

The code numbers used for each series uniquely identify the data supplier, the publication and the particular series. A “p” in front of a value means that the data is provisional and changes in subsequent months to these figures are likely. All other series should contain final data, although even final data can be subject to later revision by the data supplier. Data in bold has been revised. Where base years or series definitions have changed an appropriate footnote has been added.

The French series 12.18.81 (SYNTEC: Indice des bureaux d’étude techniques) has been converted into EURO using the ECU/FF index for January 1995, although the base for the index is January 1961. This means that the value of the index for January 1995 (164.5) is the same for both the original and the converted series, and the converted series correctly reflects the change in the EURO/FF exchange rate since then.

### **3. Exchange rates**

The exchange rates for the EURO against the national currencies of the Member States of the European Union and other major currencies are shown as annual, quarterly and monthly averages. These are based on theoretical daily exchange rates calculated by the European Commission from the market rates of the individual currencies that make up the EURO, and may not be the same as market rates quoted for the EURO.

For further explanation concerning the introduction of the EURO please refer to the notes in the introduction and the extract of the Council Regulation from 31<sup>st</sup> December 1998 and from 19<sup>th</sup> June 2000 (provided on pages 4 and 5).

### **3. Taux de change**

Les taux de change de l'EURO dans les monnaies nationales des États membres de l'Union Européenne et dans les autres monnaies importantes sont présentés en moyennes annuelles, trimestrielles et mensuelles. Ceux-ci sont fondés sur les taux de change théoriques au jour le jour calculés par la Commission européenne à partir des taux sur les marchés des monnaies nationales qui constituaient l'EURO; il se peut qu'ils diffèrent des taux du marché établit pour l'EURO.

Pour de plus amples informations concernant l'introduction de l'EURO veuillez vous référer aux notes dans l'introduction et aux extraits du règlement du Conseil du 31 décembre 1998 et du 19 juin 2000 se trouvant aux pages 4 et 5.

#### 4. Euro Indices – Conversion Methodology

For clarity, the mechanism by which the Euro indices are calculated based on the National Authority published indices of each member state, is outlined below.

The conversion is applied to all series from non-Euro area countries or to series of a Euro based country where the index base is prior to the year 2000.

It requires the following elements, all available through ESA-STAR Publication:

<https://esastar-publication-ext.sso.esa.int/>

- Administrative Documents
  - National Price and (Wage) Salary Statistics
    - In Euros (monthly updated bulletin)
    - Annual Publications

1. **The National currency value of a given index series** for a month or a quarter

2. **The value of the exchange rate (xr)** in the corresponding month or quarter.

- This value is extracted from Eurostat's reference database (Eurobase). The name of the table is Euro.ECU exchange rates. There are tables for annual, quarterly and monthly data. The unit is the national currency (including 'euro fixed' series for euro area countries).

3. **The value of the exchange rate index (xri)** for the corresponding month or quarter

- The index for one month is calculated with:
  - The value of an index of the previous month \* the exchange rate of the previous month / the exchange rate of the current month.

4. **The base value of the exchange rate index (bxri)**, which is the value of the index corresponding to the series base year.

**For the conversion National Currency > Euro, two formulas are used.**

In the majority of cases the series refer to an **index** and the formula is as follows:

**The value of the index series \* value of the xri / value of the bxri.**

Example for UK MM19 series 13.19.544 (monthly series) of January 2010 appearing in the bulletin of December 2010. This series is Base 2005 and the value of the exchange rate index base was 121.2 for UK in 2005.

UK MM19 \* January10 xri / Year 2005 bxri = Euro MM19

$$112.9 * 93.82296 / 121.2 = 87.4$$

If the series **does not refer to an index**, but a monetary value e.g. Average Weekly Earnings, the formula is as follows:

**The value of the series / value of the exchange rate**

Example for Canadian series 28.44.381 (monthly series) of March 2010 in the bulletin of December 2010.

Value of the series / value of the exchange rate =

$$527.05 / 1.3889 = 379.47$$

## 5. Consumer price indices in national currency

The consumer price indices in the national currency of each country measure changes in the purchasing power of one unit of national currency spent in the country concerned. The Statistical Office of the European Union (Eurostat) calculates two composite indices, covering all the Member States of the European Union before the latest enlargements (EU-15) and the Member States with currencies participating in monetary union (EURO). These indices are calculated as weighted arithmetic means (chain indices) of the national indices, the weight for each Member State being its relative share in the final consumption of households of the group of countries in question (EU-15 or EURO), expressed in purchasing power standards, at current prices and purchasing power parities.

Please note that prior to January 2017, HCPI figures were expressed at base year 2005=100; from January 2017 to December 2025, at base year 2015=100; and from January 2026 onwards, at base year 2025=100. Where needed, a simple link factor between any two series can be derived by comparing overlapping observations across bulletins.

Eurostat has adapted and improved its methodology, using more detailed input data since January 2019. These data concern essentially HCPI higher-level special aggregates, not published in this ESA bulletin.

Moreover, there has been another methodological change for the package holidays index for Germany. The latter has led to a number of revisions in the aforementioned higher-level special aggregates, but also the all-items inflation rate (shown in this ESA bulletin) for Germany, the euro area (EA) and the European Union (EU-28).

The German package holidays index was revised from January 2015 onwards. Consequently, the average of the 2015 monthly indices did not equal 100 anymore. In order to express the revised series in the 2015 reference year, the whole series taking into account the revisions was multiplied by a factor. This factor is specific for each series and they ensure that the average of the twelve 2015 monthly index values equals 100 for each series.

The revised indices were published in the ESA bulletin starting from February 2019. The values from 2015 to 2018 differ from those that were previously published in the ESA Monthly Bulletin up to January 2019 and in the Bi-Annual Bulletin 2016-2017 because of the revision of the German package holidays index and because of the subsequent necessary multiplication by the factor to obtain series that have an average of 100 for 2015. The values from 1996 to 2014 differ from those that were previously published only because of the multiplication by the factor. The multiplication of the values prior to 2015 has no impact on previously published monthly and annual rates, except for minor revisions stemming from rounding.
